

`seminar.sty` is a LaTeX style for typesetting slides or transparencies, and accompanying notes. Here are some of its special features: It is compatible with AmS-LaTeX, and you can use PostScript and AmS fonts. Slides can be landscape and portrait. There is support for color and frames. The magnification can be changed easily. Overlays can be produced from a single slide environment. Accompanying notes, such as the text of a presentation, can be put outside the slide environments. The slides, notes or both together can then be typeset in a variety of formats.
